Markup Assist enables novice users to generate consistent, readable, and detailed markup from any source. A new version of the markup editor is easy-to-use, and maintains a good balance between power and simplicity. The content pane on the right displays the highlights and shadows of the text selected from the source drawing. Highlights and shadows allow you to easily see the text color, size, style, and font. The notes field in the lower left corner can be toggled to display notes associated with the selected text. Drawings can now be extracted from Office files, read from FTP servers, and shared via Google Drive. This command will not change the line's endpoint, so using the command will not result in a new line (0-n). Extend: You can now choose a corner point on a line to create a wing in the angle command. You can now select a polyline or B-spline to use as the basis for a rectangle in the Mtext command. Extend now supports the XYZ option in the command line. The XYZ option allows you to specify the x, y, and z extents of a 3-dimensional shape. Move: The Dynamic Geometry preview now displays the precise distance that a line or arc segment is moved. The distance is displayed as either the number of points or a percent of the total line length. The auto-bend option in the CPLines tool now includes the option to end the CPLine at the start point or end point of the line. Quickpath in Select: Select objects in the drawing window or viewport are automatically selected or unselected. Custom UI controls: You can now access the text document UI controls by pressing the F1 key or selecting Options > Document > Text UI Controls. A new System Event (SystemEvent.CustEvent) allows you to define custom events that trigger commands that run in the system-wide event thread (for example, the script-based automatic detection of conflicts
