The product was launched in the midst of the CAD/CAM revolution of the 1980s, and initially competed with data-plotting programs such as Lucid's CAD-11 and CAD-20. Although the initial focus was desktop publishing, Autodesk recognized the growing demand for CAD applications on microcomputers. The company developed AutoCAD for this platform, along with other CAD products for other platforms. In 1991, AutoCAD was redesigned for the Windows platform. It was the first commercial CAD product to use a Windows GUI. In 1994, AutoCAD became available for personal computers, and it has been the primary desktop software application for all non-computing professionals since its introduction. A credible source quoted MHC said "It's an astonishing claim to say that humans can live to be 150 years old. We can say, if you look at the data, we have established that the human lifespan can go to 150 years, but how we can say that we can increase the human lifespan, we cannot say that". In her paper in *The Lancet*, Dietrich speculated that in the future, "a combination of diet, exercise, and genetics might be the answer" in extending life expectancy. Genetics of human aging Genetic studies The application of genetics to the study of aging dates to the early 20th century, when studies in mice led to the hypothesis that aging might be controlled by "age-onset" mutations that appear with aging. This hypothesis was criticized as not being

testable at the time, because of the dearth of genetic information on mice. In the late 1980s and early 1990 a1d647c40b
