Apex framework shipping _x86.dll apex framework shipping x86.dll The errors seem to be coming from a combination of the shipping phone and old versions of the gem install. I think most of the problems might be related to. I put the same code on a Windows PC. (nvidia-cg-toolkit)Â . nvidia-cg-toolkit I followed these instructions: HOWTO: Install NVIDIA Tesla CUDA ToolkitÂ .The present invention relates to power supply systems, and more particularly to a power supply system which is controlled to be activated when a load increases. When the power is supplied to a load after the load increases, supplying current to the load is not proper. When the conventional power supply system does not detect that the load increases, the power supply system supplies unnecessary power. Conventionally, the invention to solve the above problems was disclosed in Japanese Patent Laid-Open No. 9-309701. In this invention, power is supplied when a plurality of loads increases, thus the loads may be supplied the power after the loads are controlled to be activated. However, the above invention is not desirable because it is necessary to connect a plurality of controls to be activated. An object of the present invention is to provide a power supply system which can judge when a power supply to a load is activated, thus can judge when the load is activated, when a plurality of loads increases. In order to solve the problem, the power supply system of the present invention is a control of a power supply system which supplies power to a load when load control signals of a plurality of loads are activated, the system comprising: a plurality of power source units, which may be selected from a plurality of power source units; first detection means for detecting whether or not all of the plurality of power source units are in an inactive state; second detection means for detecting whether or not the plurality of loads are in an active state; control means for selecting a power source unit when the first detection means detects that the plurality of power source units are in the inactive state, and for supplying power when the second detection means detects that the plurality of loads are in the active state; and an operation instruction receiving means for receiving an operation instruction to each of the plurality of loads, the control means selecting a power source unit when the second detection means detects that the plurality of loads are in the active state. In this
